Today

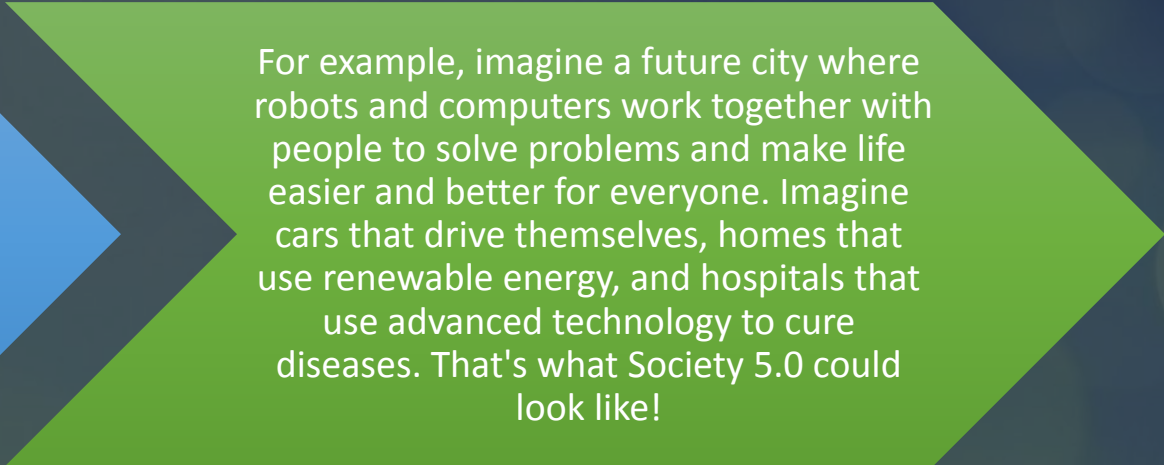

Economic and social innovation by deepening of Society 5.0

Source: Prepared based on materials from the Japan Business Federation (Keidanren)

Society 5.0 is a term used to describe a future society that is characterized by advanced technology and human-centered values. It's like a big upgrade to how we live and work today!

For example, imagine a future city where robots and computers work together with people to solve problems and make life easier and better for everyone. Imagine cars that drive themselves, homes that use renewable energy, and hospitals that use advanced technology to cure diseases. That's what Society 5.0 could look like!

Statistical process control is a tool that helps us make sure that things are working the way they should be in Society 5.0. Think of it like a teacher checking your homework to make sure you did it correctly. Just like the teacher checks your work to make sure you followed the rules and did your best, statistical process control checks to make sure that robots and computers are doing what they're supposed to do.

For example, let's say that a factory is making cookies and wants to make sure that each cookie is the same size and shape. The factory could use statistical process control to measure the size and shape of each cookie and make sure that they are all the same. If the cookies aren't the same, the factory can use the information from statistical process control to make improvements and make sure that they are all the same size and shape in the future.

So, Society 5.0 is like a big, exciting upgrade to how we live and work, and statistical process control is a tool that helps us make sure everything is working correctly and efficiently.
