

FUNDAMENTALS OF PROGRAMMING

Lecture 11: MULTIDIMENSIONAL ARRAYS

Instructor: Dr Aqib Perwaiz

Multi Dimensional Arrays (Matrices)

- An array can have two or more dimensions. This permits them to model multidimensional objects, such as graph paper or the computer display screen.
- They are often used to represent **tables of values** consisting of information arranged in **rows** and **columns**.

Multi Dimensional Arrays (Matrices)

- To identify a particular element, we must specify two subscripts. By convention,

array_name[row_number][col_number]

- For example,

`arr[i][j]`

Multiple-Subscripted Arrays

- Multiple subscripted arrays
 - Tables with rows and columns (m by n array)
 - Like matrices: specify row, then column

	Column	Column 1	Column	Column 3
Row 0	a[0][0]	a[0][1]	a[0][2]	a[0][3]
Row 1	a[1][0]	a[1][1]	a[1][2]	a[1][3]
Row 2	a[2][0]	a[2][1]	a[2][2]	a[2][3]

Array name Row subscript Column subscript

6.9 Multiple-Subscripted Arrays

- `int a[3][4];`

	Column	Column 1	Column	Column 3
Row 0	<code>a[0][0]</code>	<code>a[0][1]</code>	<code>a[0][2]</code>	<code>a[0][3]</code>
Row 1	<code>a[1][0]</code>	<code>a[1][1]</code>	<code>a[1][2]</code>	<code>a[1][3]</code>
Row 2	<code>a[2][0]</code>	<code>a[2][1]</code>	<code>a[2][2]</code>	<code>a[2][3]</code>

Array name `a` points to the first element of the first row.
 Row subscript points to the first element of the first row.
 Column subscript points to the first element of the first row.

6.9 Multiple-Subscripted Arrays

- Initialization

- `int b[2][2] = { { 1, 2 }, { 3, 4 } };`
- Initializers grouped by row in braces

`b[0][0]`

`b[0][1]`

1	2
3	4

`b[1][0]`

`b[1][1]`

6.9 Multiple-Subscripted Arrays

- Initialization

- `int b[2][2] = { { 1, 2 }, { 3, 4 } };`
- Initializers grouped by row in braces

1	2
3	4

- If not enough, unspecified - **elements set to zero**

1	0
3	4

`int b[2][2] = { { 1 }, { 3, 4 } };`

- Referencing elements

- Specify row, then column
`cout<<b[0][1];`

Initializing a 2D Array

- `int matrix [10] [2] = { {59 , 78},{14 , 17},{68 , 28},{32 , 45},
{ 5 , 14},{12 , 15}, {6, 2}, { 22,1},
{14,16},{2, 58} };`
- The values used to initialize an array are **separated by commas and surrounded by braces**.

2-D Array (Matrix)

```
int matrix [4] [4] = { {59, 78,14, 17},{68, 28,32, 45},  
                      {5, 14,12, 15} ,{6, 2, 22, 1} };
```

(row = 2, col = 0)

59 (0,0)	78 (0,1)	14 (0,2)	17 (0,3)
68 (1,0)	28 (1,1)	32 (1,2)	45 (1,3)
5 (2,0)	14 (2,1)	12 (2,2)	15 (2,3)
6 (3,0)	2 (3,1)	22 (3,2)	1 (3,3)

4 x 4 Matrix

Reading a 2D Array

```
int matrix [4][4]={ {59,78,14,17}, {68,28,32,45},  
                    {5, 14,12,15}, {6,2, 22, 1}};
```

```
for(int i=0;i<4;i++)  
{  
for(int j=0;j<4;j++)  
{  
cout<<matrix[i][j]<<"\t";  
}  
cout<<endl;  
}
```

Example

- Write a matrix with following entries

12	12
54	34
16	3
12	6
43	23
1	2

2D String

1001	A	l	i	\0					
1011	A	b	b	a	s	\0			
1021	A	l	i	n	a	\0			
1031	A	y	e	s	h	a	\0		
1041	B	a	n	o	\0				

2D array of characters

```

1  /* Fig. 6.21: fig06_21.c
2      Initializing multidimensional arrays */
3  #include <stdio.h>
4
5  void printArray( const int a[][ 3 ] ); /* function      */
   prototype
6
7      /* function main begins program execution */
8  int main()
9  {
10     /* initialize array1, array2, array3 */
11     int array1[ 2 ][ 3 ] = { { 1, 2, 3 }, { 4, 5, 6 } };
12     int array2[ 2 ][ 3 ] = { { 1, 2, 3, 4, 5 };
13     int array3[ 2 ][ 3 ] = { { 1, 2 }, { 4 } };
14
15     cout<<"Values in      by row are:\n" ;
   array1
16     printArray( array1 );
17
18     cout<<"Values in      by row are:\n" ;
   array2
19     printArray( array2 );
20
21     cout<<"Values in      by row are:\n" ;
   array3
22     printArray( array3 );
23     return 0; /* indicates successful termination */
24
25 } /* end main */
26
27

```

```
28 /* function to output array with two rows and three columns */
29 void printArray( const int a[][ 3 ] )
30 {
31     int i; /* counter */
32     int j; /* counter */
33
34     /* loop through rows */
35     for ( i = 0; i <= 1; i++ ) {
36
37         /* output column values */
38         for ( j = 0; j <= 2; j++ ) {
39             cout<<a[ i ][ j ] ;
40         } /* end inner for */
41
42         cout<<"\n" ; /* start new line of output */
43     } /* end outer for */
44
45 } /* end function printArray */
```

Program Output

```
Values in array1 by row are:
1 2 3
4 5 6
Values in array2 by row are:
1 2 3
4 5 0
Values in array3 by row are:
1 2 0
4 0 0
```

Examples Using Arrays

- Character arrays

Its is used in programming for storing and manipulating text, such as words, names and sentences.

- Character arrays can be initialized using string literals

```
char string1[] = "first";
```

- Null character '`\0`' terminates strings

- `string1` actually has 6 elements

- It is equivalent to

```
char string1[] = { 'f', 'i', 'r', 's', 't', '\0' };
```

- Can access individual characters

`string1[ 3 ]` is character '`s`'

Character arrays

- Like all other variables and arrays

```
char name[5];  cin >> name;  
cout<< "you entered " << name;
```

- The << operator displays the output until it encounters a null character.
- In case of a string variable, the cin operator places the null automatically.

Multi-Dimensional Strings (Array of Strings)

- char stu_lists [5] [10] = {"Ali",
"Abbas",
"Alina",
"Ayesha",
"Bano",
};
- 
- The diagram consists of two black arrows. One arrow starts from the number '5' in the array declaration and points diagonally upwards and to the right towards the first string 'Ali'. The other arrow starts from the number '10' and points diagonally upwards and to the left towards the same first string 'Ali'.

Passing Elements of an Array to a Function

- Arrays are passed
 - By Reference

Passing Arrays to Functions

- Passing arrays

- To pass an array argument to a function, specify the name of the array without any brackets

```
int myArray[ 24 ]; myFunction( myArray, 24 );
```

- Array size usually passed to function

- Arrays passed **call-by-reference**
 - Name of array is address of first element
 - Function knows where the array is stored
 - Modifies original memory locations

- Passing array elements

- Passed by call-by-value
 - Pass subscripted name (i.e., myArray[3]) to function

Passing Arrays to Functions

- Function prototype

```
void modifyArray( int b[], int arraySize );
```

- Parameter names optional in prototype only

- `int b[]` could be written `int []`
- `int arraySize` could be simply `int`

- The following are equivalent prototypes:

```
void modifyArray( int b[], int arraySize );
```

```
void modifyArray( int [], int );
```
