

EC-200 DATA STRUCTURES

LECTURE 8

WHAT WILL BE THE OUTPUT

```
void fun( )  
{  
    cout<< "Hello World";  
    fun( );  
}
```

```
void main( )  
{  
    fun( );  
}
```

WHAT WILL BE THE OUTPUT

```
void fun( )  
{  
    fun( );  
    cout<< "Hello World";  
}
```

```
void main( )  
{  
    fun( );  
}
```

WHAT WILL BE THE OUTPUT

```
void fun(int i )  
{  
i=i-1;  
cout<<i;  
fun(i);  
}
```

```
void main( )  
{  
Int j=8;  
fun(j);  
}
```

THINK?

What amendments in the code given below will result in printing of Hello World 10 times on console?

```
void fun( )  
{  
    cout<< "Hello World";  
    fun( );  
}  
void main( )  
{  
    fun( );  
}
```

RECURSION

- Recursive tasks:
 - A task that is defined in terms of itself.
 - A function that calls itself.
 - With each invocation, the problem is reduced to a smaller task (**reducing case**) until the task arrives at some **terminal case**.

RECURSION

- A recursive function has two parts:
 - the terminal/base case.
 - - a stopping condition
 - the reducing case/recursive step
 - an expression of the computation or definition in terms of itself

GENERAL ALGORITHM FOR RECURSION

```
if  
  (terminal_conditio  
   n)  
  terminal_case  
else  
  reducing_case
```

```
if (!terminal_condition)  
  reducing_case
```

THE FACTORIAL FUNCTION

- $n! = n * (n-1) * (n-2) * \dots * 2 * 1$
- $5! = 5 * 4 * 3 * 2 * 1$
- The same function can be defined recursively as follows:
 - $0! = 1$ – **terminal case**
 - $n! = n * (n - 1)!$ - the reducing case

THE FACTORIAL FUNCTION

- $5! = 5 * 4!$
- $4! = 4 * 3!$
- $3! = 3 * 2!$
- $2! = 2 * 1!$
- $1! = 1! * 0!$
- **$0! = 1$ - Terminal Case**

Reducing Case

FACTORIAL RECURSIVE FUNCTION

```
int fact(int n)
// -----
// Computes the factorial of a nonnegative integer.
// Precondition: n must be greater than or equal to 0.
// Postcondition: Returns the factorial of n; n is
// unchanged.
// -----
{
    if (n == 0)
        return 1;
    else
        return n * fact(n-1);
} // end fact
```

RECURSIVE CALLS IN FACTORIAL

```
cout << fact(3);
```

RECURSIVE CALLS IN FACTORIAL

```
(factorial 6)
(* 6 (factorial 5))
(* 6 (* 5 (factorial 4)))
(* 6 (* 5 (* 4 (factorial 3))))
(* 6 (* 5 (* 4 (* 3 (factorial 2)))))
(* 6 (* 5 (* 4 (* 3 (* 2 (factorial 1)))))
(* 6 (* 5 (* 4 (* 3 (* 2 1)))))
(* 6 (* 5 (* 4 (* 3 2))))
(* 6 (* 5 (* 4 6)))
(* 6 (* 5 24))
(* 6 120)
```

CLASS TASKS

- Write a recursive function in linked list ADT, traverse to display data in list
- Write a recursive function in linked list ADT `search(node*ptr,int data)` to search data in list
- Write a recursive function `power(int n, int x)` to find n^x

SAFELY ENDANGERED

**SWEET JESUS, POOH!
THAT'S NOT HONEY**

YOU'RE EATING RECURSION
